

Dear Ishan,

We request the development of a comprehensive Supply Chain and Logistics Dashboard to provide centralized visibility into Samsung's end-to-end supply chain operations. Currently, performance data across revenue, inventory, shipments, suppliers, carriers, and customers is fragmented, making it difficult for leadership to quickly identify inefficiencies, risks, and optimization opportunities.

The objective of this dashboard is to consolidate key supply chain KPIs such as gross and net revenue, profit margins, shipment volumes, inventory stock levels, lead times, order fulfillment, and delay trends into a single, interactive view. The dashboard should enable stakeholders to identify carriers with the least and most delays, suppliers with quality or lead-time concerns, manufacturing plants with capacity constraints, and customers or platforms contributing most to revenue or underperformance.

Additionally, the dashboard should support comparative analysis between top- and bottom-performing entities, allowing decision-makers to drill down into supplier performance, platform-wise revenue contribution, inventory health by product, and delay patterns by carrier. By transforming raw operational data into actionable insights, this dashboard will help improve service levels, reduce delays, optimize inventory, and support data-driven strategic decisions across supply chain and logistics teams.

Sincerely,
Business Analytics Team
